

Reference model

 $u(t) = \widehat{\boldsymbol{K}}_c(t)\boldsymbol{x}(t) + \hat{L}(t)r(t)$

 $\widehat{\boldsymbol{K}}_{c}(t) = \gamma \boldsymbol{B}_{mc}^{T} \mathcal{P} \boldsymbol{E}(t) \boldsymbol{x}^{T}(t)$ $\hat{L}(t) = \gamma \boldsymbol{B}_{ms}^T \mathcal{P} \boldsymbol{E}(t) r(t)$

where T_S is sampling time, $\gamma > 0$ is the adaptation gain, $\boldsymbol{x}(t) = [y(t), \dot{y}(t)]^T$, $\boldsymbol{E}_m(t) = [e_m(t), \dot{e}_m(t)]^T$, and

 $\boldsymbol{A}_{mc}^T \mathcal{P} + \mathcal{P} \boldsymbol{A}_{mc}^T = -\boldsymbol{I}_{2x2}$

 $y_m(t)$

Control law:

Adaptation law:

matrix $\mathcal{P} = \mathcal{P}^T$ satisfies:

Reference $r(t) = r_1(t) + r_2(t) + r_3(t)$
